

# NATURAL STONE

## 1 - MINERALOGY

Story materials and conservation of the built heritage – Natural Stone – Mineralogy – BR 1

---

---

---

---

---

---

---

---

### Definitions

**Natural Stone = Rock** = natural material constituting the crust and mantle. Generally, it is solid (≠ unconsolidated sediments like sand) and made of aggregate of **minerals** more or less closely knitted together (gaps = **pores**)

Story materials and conservation of the built heritage – Natural Stone – Mineralogy – BR 2

---

---

---

---

---

---

---

---

### Definitions

**Mineral** = **inorganic** natural compound (although some of them may be bioproducts like apatite, calcite, oxalates...) with a **definite chemical composition**, an **atomic structure** and **physical properties** of its own. Generally, it is **solid** (≠ mercury)

**Cristal** = **homogeneous solid** composed of atoms, ions or molecules with an **organized arrangement** that is **repeated periodically** in three dimensions of space (cristal ≠ amorphous compounds)

Story materials and conservation of the built heritage – Natural Stone – Mineralogy – BR 3

---

---

---

---

---

---

---

---

### Classification of minerals

According to chemical composition and crystal structure.  
 Example: Nickel-Strunz Classification - 10th edition  
 (system adopted by the International Mineralogical Association):

1. **Native elements** (C, S, Au, Ag, Cu, Bi, As, Sb,...)
2. **Sulfides (S<sup>2-</sup>) and sulfosalts** (selenides, tellurides, ...)
3. **Halides** (Cl, F,...)
4. **Oxides (O<sup>2-</sup>), hydroxides (OH<sup>-</sup>)**
5. **Carbonates (CO<sub>3</sub><sup>2-</sup>), nitrates (NO<sub>3</sub><sup>-</sup>)**
6. **Borates** (borax,...)
7. **Sulphates (SO<sub>4</sub><sup>2-</sup>)** (+ thiosulfates, chromates, molybdates,...)
8. **Phosphates (PO<sub>4</sub><sup>3-</sup>)**
9. **Silicates ((Si,Al)<sub>x</sub>O<sub>2x</sub>+/-alk. and alk. earth met.)**
10. **Organic compounds** (formates, oxalates, acetates, hydrocarbons, amber...)

Story minerals and conservation of the built heritage - Natural Stone\_Minerology\_BB 4

---

---

---

---

---

---

---

---

---

---

---

---

### Distribution of elements within the earth

➔ **silicates (& other light minerals) are the most abundant minerals in the earth's surface**

Story minerals and conservation of the built heritage - Natural Stone\_Minerology\_BB 5

---

---

---

---

---

---

---

---

---

---

---

---

### The silicate class

The silicates are the largest, the most interesting and the most complicated class of minerals. ≈ 30% of all minerals are silicates and 90% of the Earth's crust is made up of silicates.

The basic chemical unit of silicates is the (SiO<sub>4</sub>) tetrahedron shaped anionic group **with a negative four charge (-4)**.  
**But a mineral must be neutral !!!**

Story minerals and conservation of the built heritage - Natural Stone\_Minerology\_BB 6

---

---

---

---

---

---

---

---

---

---

---

---

### The silicate class - The clay minerals (phyllosilicates)

Example of 2:1 (or T-O-T) layer silicate : smectite = montmorillonite = bentonite

FIG. 4. Smectite structure.

FIG. 5. SEM of Na-montmorillonite (Wyoming).

H. H. Murray, 1999. Applied clay mineralogy today and tomorrow, Clay Minerals, V.34, p. 39-49

---

---

---

---

---

---

---

---

---

---

---

### The silicate class - The clay minerals (phyllosilicates)

name	type	particule diameter (µm)	specific surface area (m <sup>2</sup> /g)	CEC (meq/100g)
Kaolinite	1:1	0.1 - 4	10 - 30	3 - 15
Illite	2:1	0.1 - 1	100 - 175	25 - 40
Smectite (montmorillonite)	2:1	0.1	700 - 840	80 - 100
Vermiculite	2 : 1	0.1	760	100 - 150
Chlorite	2:1:1	0.1	20	5 - 15

Tableau 6: Caractéristiques des différentes familles d'argile.

CEC = cation exchange capacity

Minerals and rocks

Cardinal minerals:

60 to 70% of the rock (usually white or slightly colored)  
*quartz, feldspars, feldspathoids, calcite*

Essential minerals:

20 to 25% of the rock (often dark)  
*micas, amphiboles, pyroxenes, olivine,...*

Accessory minerals:

5 to 10% of the rock  
*oxides, sulfides,...*

---

## Genesis of minerals and rocks

### Endogenous genesis (in depth)

- **magmatic process:** coming from a magma
- **metamorphic process:** transformation of pre-existent mineral materials

### Exogenic genesis (at the surface)

- **sedimentary process:** pre-existent mineral materials transformation and/or neo-formation

Study materials and conservation of the built heritage - Natural Stone - Mineralogy - BR / 18

## A few examples of minerals

Additional document on <http://www.csc-sarl.ch>:  
(under the schedule)

### Mineral examples

#### Silicate minerals:

- Garnets (nesosilicates)
- Asbestos (inosilicates)
- Micas (phyllosilicates)
- Clay minerals (phyllosilicates)
- Serpentinites (phyllosilicates)
- Quartz (tectosilicate)
- Feldspars (tectosilicates)

#### Non silicate minerals:

- Carbonates
- Sulfates
- Halides
- Oxides
- Sulfides
- Phosphates
- Native element minerals

Study materials and conservation of the built heritage - Natural Stone - Mineralogy - BR / 18

---

---

---

---

---

---

---

---

---

---

---

---

**The identification criteria of minerals,  
simple tests that sometimes can be also used  
for stones ...**

Stony materials and conservation of the built heritage – Natural Stone – Mineralogy – BR 19

---

---

---

---

---

---

---

---

**The identification criteria of minerals**

**Cleavage / fracture:** in some minerals, bonds between layers of atoms aligned in certain directions are weaker than bonds between different layers. In these cases, breakage occurs along smooth, flat surfaces parallel to those zones of weakness

Stony materials and conservation of the built heritage – Natural Stone – Mineralogy – BR 20

---

---

---

---

---

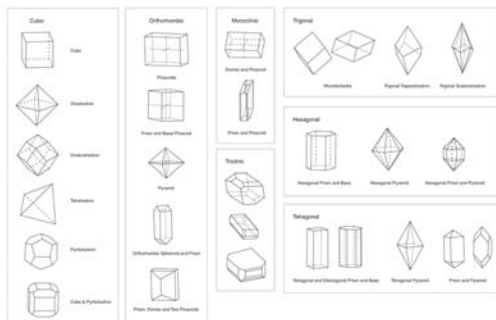

---

---

---

**The identification criteria of minerals**

**Crystal shape:  
the 7 crystal  
systems**

Stony materials and conservation of the built heritage – Natural Stone – Mineralogy – BR 21

---

---

---

---

---

---

---

---

### The identification criteria of minerals

**Twinning (maclé):** Crystal twinning occurs when two separate crystals share some of the same crystal lattice points in a symmetrical manner. The result is an intergrowth of two separate crystals in a variety of specific configurations.

Stony materials and conservation of the built heritage – Natural Stone – Mineralogy – BR 22

---

---

---

---

---

---

---

---

---

---

---

---

### The identification criteria of minerals

- Density:** physical constant (2.7 g/cm<sup>3</sup> for silicates)
- Colour:** not a differential criteria
- Streak (trait):** colour of the powder, more reliable than the colour of the mineral itself (Scratch unglazed porcelain => This only works for minerals which are softer than a ceramic tile (hardness ~ 7))
- Luster (éclat):** aspect of the surface mineral when it reflects light
- Flam test:** the color of flames depends on the chemical composition (Ca: red, Na: yellow, Cu: blue or green, K: violet...)

Stony materials and conservation of the built heritage – Natural Stone – Mineralogy – BR 23

---

---

---

---

---

---

---

---

---

---

---

---

### The identification criteria of minerals

**Hardness:** Mohs scale of relative mineral hardness
